

# PIRM II - Automated Battery Characterization

**Team:** sddec20-25

**Advisor:** Nathan Neihart

**Client:** Solar Car

**Website:** <http://sddec20-25.sd.ece.iastate.edu/>

**Team Lead:** Joe DeFrancisco Email: [joedef@iastate.edu](mailto:joedef@iastate.edu)

Joe DeFrancisco, Ben Kenkel, Bryan Kalkhoff,  
Connor Luedtke, Ryan Willman, Kyle Czubak

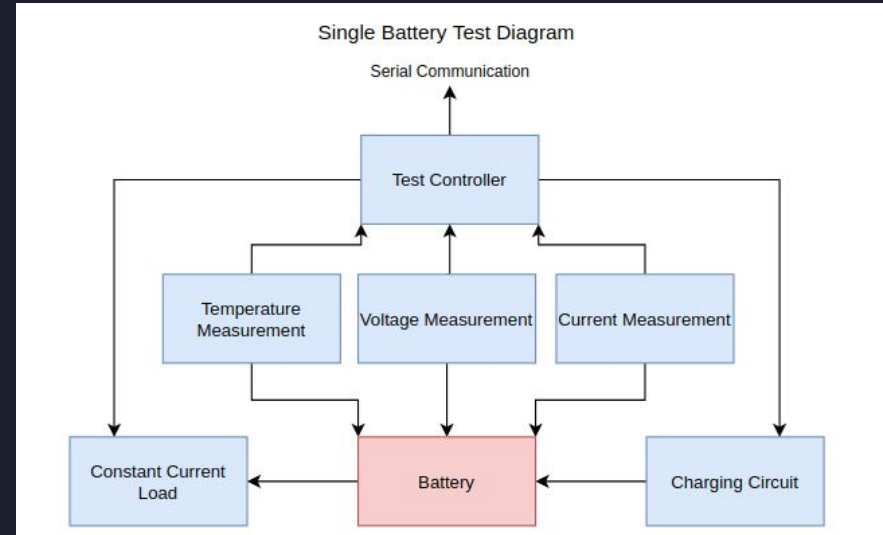

# Project Overview - Recap

- Best performance with matched batteries
- PriSUm Solar Car currently does not have an efficient way of characterizing batteries on a battery pack scale.
  - Currently the procedure is to measure the open circuit voltage of each battery and group them based on that measurement.
- Process is time consuming on large scale (1000 or more batteries)
- We will design and build an automated lithium battery characterizer

# Block Diagram - Recap

- Test Controller- Microcontroller
  - Will communicate with pi via CAN
- The micro will control charging/discharging
  - Enabling for each battery independently
- The micro takes all the information and sends it to a pi via CAN
  - The pi handles the user interface

# Current Status

## Hardware:

- A couple of prototypes have been ordered and tested
  - Microcontroller development board
  - Load Circuit
- Schematic for Rev 1 finalized
- Rev 1 PCB Layout Complete
  - Ready to order on 10/5/2020

## Software:

- Flask app setup and running
  - Including database
- Microcontroller communication libraries being written

# PCB Layout

# Flask App

## Automated Li-Ion Battery Characterizer

Set Up Test

## Select Pack

Back

Select a Pack

Submit

# Technical Challenges

- Board Layout
  - High current design
  - Thermal management
  - Physical Size of PCB
- Flask App
  - Two very different use case environments
    - PI - Touchscreen only, used for starting/stopping the test
    - Computer - More configuration options and fetching test data

# Semester Goals-Updated

- Have Revision 1 Hardware
  - Completed PCB design and have ordered rev1
- Completed Embedded Code
  - Code was started and currently in development
- Enclosure Designed
  - With finalized board dimensions, designing the enclosure has started
- Test Hardware
  - Will be done when rev 1 comes in
- Test Hardware and Software interaction
  - Will be done when rev 1 comes in
- Communicate between modules and app
  - Will be done when rev 1 comes in

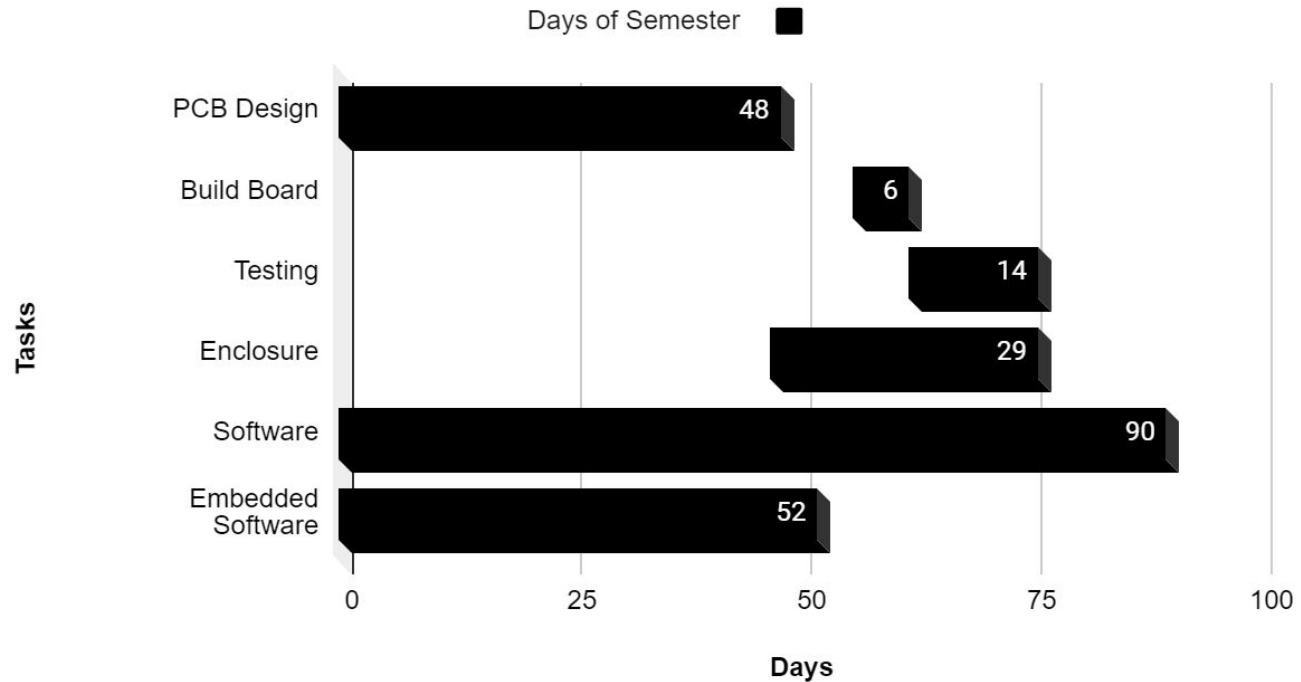

# Next Steps

- Hardware
  - Order Board and parts
  - Test Test Test Test Test
- Software
  - Create final firmware for batter characterizer
  - Communicate between modules and pi
  - Finish more pages for Flask app
- Enclosure Design

# Timeline

## Current Project Timeline - Second Semester

# Enclosure
